Care, protection and regeneration of skin prone to warts

Warts are caused by viruses (HPV). These viruses can only propagate by re-programming healthy skin cells to become host cells, which produce new viruses. To do so, they first have to penetrate healthy cells.

Regular use of **Spirularin®VS** skin cream restores the natural balance of skin that is susceptible to warts using high-quality, nourishing ingredients.

Special sugar molecules (polysaccharide calcium-Spirulan) in the microalgae active ingredient Spiralin® cover healthy skin cells with a kind of "protective film". This prevents viruses from penetrating healthy cells. Regular application protects uninfected cells until all the infected cells disappear as a result of the natural skin regeneration process¹⁾ and outer sources of infection (e.g. swimming pools) are excluded.

APPLICATION:

Apply a thin layer of **Spirularin®VS** twice daily to the infected areas (usually the soles of the feet or hands). **Spirularin®VS** can be combined with any standard method of wart treatment and is safe for children (from 3 years of age), diabetics, expectant and nursing mothers.

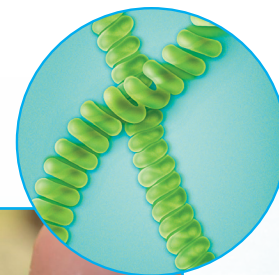

Rosemary oil & sunflower oil

- Nourishing
- Keeps skin smooth & soft
- Lasting effect on cell regeneration

Spiralin® microalgae extract

- Nourishing, protective and regenerative qualities
- Protects against viruses²⁾³⁾⁴⁾

Willow bark extract & zinc

- Antimicrobial
- Anti-inflammatory
- Kind to the skin
