Application and mode of action.

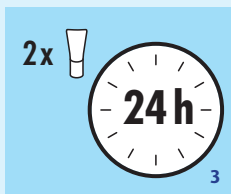

With patented microalgae active ingredient Spirularin®

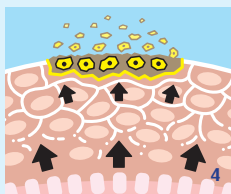

Warts develop when healthy skin cells are infected by viruses. Apply Spirularin® VS Cream sparingly to the affected area. The natural active ingredient Spirularin® acts like a protective film around healthy skin cells and stops the spread of the infection.

To prevent the viruses from spreading to healthy cells, apply the cream to the wart and surrounding skin within a radius of 3 cm.

Spirularin® VS cream is highly effective: Apply a small quantity to the wart and rub it into the surrounding area to protect healthy skin for 24 hours. Repeat application until the keratinised area feels as soft as the surrounding skin.

The wart cannot grow any further and is shed in the process of natural skin regeneration and the balance of your skin is restored in a completely natural way.
